

ABSTRACT

To provide an integrated gas valve in which there is no turbulent portion in carrying gas so that process gas supplied into the carrying gas is not diffused. The integrated gas valve 1 comprising a plurality of opening/closing valves 30 in each of which a valve element 33 is brought into contact with and separated from a valve seat 34 by an actuator 31 to communicate and shut off a valve port 35 with and from a valve chamber 36, the opening/closing valve including a first passage 26 formed through a valve main body 12 so as to be branched midway from the valve port 35 and a second passage 29 formed in the valve main body 12 to extend from an inlet port to the valve chamber, wherein the plurality of opening/closing valves are arranged in line to form a main passage 23 in which the first passages 26 are connected to each other in series directly or through a connecting passage 27 and the second passage 39 of each opening/closing valve is connected to the main passage 23 through the valve chamber 36 and the valve port 35.
